

Clarification on the Human readable

According to the specification, the upUI(s) (former “Human readable”) is the UI made visible in the human readable format on the unit packets.

The upUI(s) must be unique and it is composed by the ID issuer's prefix and a serialisation element.

The serialisation element in all our codes is composed by a “Serial number” and “Product code”. This structure was implemented before 2.0 version, which means upUI(i) (pre 2.0 format) has the **same structure** as upUI(s).

Version 2.0 Formats:

upUI(i) = ID Issuer prefix + Serial number + Product code

upUI(s) = ID Issuer prefix + Serial number + Product code

Example:

upUI(i) = QCALL1rg5ryJoy00AY

upUI(s) = QCALL1rg5ryJoy00AY

You can find complete specification in Data qualifier guide document.
